                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 8
of the autonomous nervous system, e.g. Bradbury-Eggleston, Sky-Drager
                for abnormal blood pressure and other cardiovascular diseases, including myocardial infarction and stroke. Other conditions that can be determined include neuropsychiatric disease, such as depression, anxiety, attention deficit disorder with hyperactivity, eating disorders, e.g. anorexia nervosa and bulimia, or post-traumatic stress disorder. Diseases
                                                                                                This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as
                                                                                                                                                                                             Claim 8; Fig 2a; 27pp; German.

The cDNA c/one pRR14-35 is 3400bp long; the 5′1100bp were seguenced and found to overlap the clone pR14-5.3.3.1 (see AAQ29269). The sequence can be inserted into a eukaryotic expression vector for use in transforming suitable host cells. Cell lines producing human neuronal calcium channel proteins can be used for screening for Ca channel ligands (agonists or antagonists). See also AAQ29259-Q29274.

                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                        (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polypucieotides of the invention can also be used in gene therapy. AAS41685-AAS42192 represent DNA sequences encoding for the novel human enzyme polypeptides of the invention.
                                                                                                                                                                                                                                  disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders
                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the isolation of novel human enzyme polypeptides (AAUZ2915-AAUZ3814), and the cDNA and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous

                                                                                                                                                                                                                             amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17-NOV-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 08-DEC-
                                                                                                                             protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic related diseases, especially cancers and cancer metastases of haematopoietic derived cells. AAK64703 to AAK87594 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAKS4942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                               Sequence 6131 BP; 1422 A; 1665 C; 1561 G; 1483 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                       AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; SEQ ID NO 24596; 3071pp + Sequence Listing; English.

1. Cytosine at position 520 (T: 3507); no change in deduced amino acid sequence. 2. Cytosine at position 775 (G: 3768); no change in deduced An sequence. 3. Cytosine at position 1617 (T:4611).
4. Adenosine at position 2360 (G: 5353). 5. deletion of 6 nucleotides at position 708 (CGGAAA; 3695-3700). 6. deletion of an Adenosine
                                                                                                                                                                                                                                                                                                                                The sequence can be inserted into a eukaryotic expression vector for use in transforming suitable host cells. Cell lines producing human neuronal calcium channel proteins can be used for screening for Ca
                                                                                                                                                                                                                                                                                                                                                                                            residue at position 1013 which leads to a stop codon at position 1028-1030. 7. at position 3240 there are a further 2199 nucleotides of the 3'UTR which are absent from pR14-5.3.3.1. (The deletion of Adenosine at position 1013 is thought to be a cloning artefact).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cloned human neuronal calcium channel sub-types - useful in calcium flux assays to screen for neurone-specific calcium channel ligands
                                                                                                                                                                                                                                                                      Sequence 6232 BP; 1250 A; 1914 C; 1827 G; 1240 T; 1 other;

                                                                                                                                                                                                                                                                                                                                                                                     clones to span nearly the entire length of the nucleotide sequence encoding the human alpha 1B subunit was obtained. PCR amplification of specific regions of the IMR32 cell alpha 1B mRNA yielded additional segments of the alpha 1B coding sequence. A full-length alpha 1B DNA clone was constructed by ligating portions of the partial CDNA clones (see AAQ37817, AAQ37818). Alpha 1B-1 and alpha 1B-2 are derived by alternative splicing of the alpha 1B subunit

CC library to identify overlapping clones that in turn were used to screen a human hippocampus cDNA libary. A series of clones CC to span nearly the entire length of the nt. sequence encoding the human alpha 1B subunit was obtd. Nucleic acid amplification CC of specific regions of the IMR22 cell alpha 1B mRNA yielded CC additional segments of the alpha 1B constructed by ligating portions CC of the partial cDNA clone was constructed by ligating portions CC of the partial cDNA clone was constructed by ligating portions CC of the partial cDNA clones. Nucleic acid amplification analysis of the partial cDNA clones. Nucleic acid amplification analysis CC of IMR22 cell RNA and genomic DNA using oligo primers corresp. to sequences located 5' and 3' of the stop codon of the DNA encoding the alpha 1B subunit revealed an alternatively spliced alpha CC the alpha 1B subunit revealed an alternatively spliced alpha CC to include another exon that is not present in the mRNA corresp. To the other 3' alpha 1B cDNA sequence that was initially isolated. CC to the other 3' alpha 1B cDNA sequence contg. an additional CC whereas the other form is referred to as alpha 1B-2 and is given in ANG84659/R71006. Following the sequence of the additional exon in CC alpha 1B-1 the alpha 1B-1 and alpha 1B-2 sequences are identical.

A portion of one of the positive clones was used to screen an IMR32 cell cDNA library. Clones that hybridised to the basal ganglia probe were used to further screen an IMR32 cell cDNA

Eaton Syndrome (LES) can be used as a diagnostic for the disease.

```
The present sequence encodes the alpha-1B subunit of a human calcium channel. The present sequence is derived from alternative splicing of AAV42685. Calcium channels are membrane-spanning, multi-subunit proteins that allow controlled entry of calcium ions into cells. This leads to depolarisation events required for muscle contraction. The
                                       the subunits can be alternatively spliced when transcribed, giving more than one form of the protein from the same transcript, each having slightly different properties. In addition, the reactivity of the alpha 1 subunit with IgG molecules from the serum of an individual with Lambert
                                                                                                complete calcium channel, can be used in assays for the detection and characterisation of compounds that modulate the channel. The DNA encoding
                                                                                                                                                                                                                                   Claim 1; Columns 91-106; 166pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              allele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader sequence, which encodes a peptide which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity, diabetes, vascular disease, premature labour, migraine, anaphylaxis and chronic obstructive pulmonary disease (COPD). The gene can, therefore, be used to predict the susceptibility of an injurious it the susceptibility of an injurious in the susceptibility of an injurious contents.
                                                                                                                     Canine beta 2 and beta 3 adrenergic receptors and coding sequences useful for identifying specific ligands and (ant)agonists to develop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphisms in the leader cistron (LC) of the beta 2-adrenergic receptor (beta 2 AR), useful for predicting genetic disposition to a disease modified by beta 2 AR expression e.g. congestive heart failure,
beta-2 receptor can be used in comparative
                Primers AAV30491-V30510 were used for sequencing the coding region of the canine beta 2-adrenergic receptor (RA-Ca-b2) gene (AAV30468). The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                               modification of post-transcriptional protein expression in eukaryotic cells may be carried out through the targeting specific interactions of proteins that bind to RBBs. The gene fragments of the invention are used to identify their optimized sub-fragments, compounds that affect RNA/RBP interaction or mRNA functionality; or RBPs that interact with the compounds identified using the gene fragments are potentially useful for therapeutic regulation of gene expression, such as in cases of neurodegeneration, stroke; cardiovascular disease, hypertension, cancer.

```
This sequence encodes the protein of the invention. The protein of the invention is a beta-2 adrenalin receptor subtype with Kd value of approximately 75 pM against 125I-cyanopindrol. The protein can be used in screening for agonists and antagonists, which are useful in researching asthmatic diseases.
Human beta2 adrenergic receptor beta2AR gene.

                                                                                                                                                                                                                                                                      influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity, diabetes, vascular disease, premature labour, migraine, anaphylaxis and chronic obstructive pulmonary disease (COPD). The gene can, therefore, be used to predict the susceptibility of an individual to these diseases and
                                                                                                                                                                                                                                                                                                                                                 adrenergic receptor (beta2AR) gene, which is located on chromosome 5q31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the Tallele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader sequence, which encodes a peptide which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to

                                                                                                                                                                 AAV52614
                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                           This sequence represent the coding region of the canine beta 2-adrenergic receptor (RA-Ca-b2) gene. The sequence was isolated from a cDNA library constructed from polyA+ RNA purified from dog brown adipose tissue cells. The probe was a 600 bp fragment of the coding region of the human beta-3 adrenergic receptor covering the region from the initiation codon to transmembrane domain 5 (TM5). The full length insert was cloned into M13 for sequencing using primers AAV30491-V30510. The sequence can then be expressed e.g. in a mammalian cell, by subcloning into an expression vector such as pCDNA3. The beta-2 receptor can be used in comparative structure-function studies, e.g. for differential screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Canine beta 2 and beta 3 adrenergic receptors and coding sequences - useful for identifying specific ligands and (ant)agonists to develop specific treatments for obesity in dogs
                                                      Human beta-2-adrenergic receptor cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or perferably comprises amplifying at residue 16, and optionally also options to comprise the sequence analysis. The includes the sequence analysis. The inventor of these portions of these portions of the parameter of the second alleles of the beta 2-adrenergic receptor gene, and (b) classifying an individual as susceptible if first and second alleles both encode Arg at residue 16 of the beta 2-adrenergic receptor protein. Beta 2-adrenergic receptor gene alleles may be identified by any known method e.g. denaturing gel electrophoresis or PCR amplification (see also AAV52615-17). Identification preferably comprises amplifying a portion of each allele which includes the sequence encoding residue 16, and optionally also by automated sequence analysis). The invention identifies a known in the heat 2-adreners in the protection of these portions (e.g. by automated sequence analysis). The invention identifies a known in the heat 2-adreners in the protection of the protection is a known in the protection of the protection is a known in the protection of the protection is a known in the protection of the protection is a known in the protection of the protection is a known in the protection of the protection is a known in the protection in the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protection is a protection of the protection in the protec

This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including myocardial infarction and stroke. Other conditions that can be determined include neuropsychiatric disease, such as depression, anxiety, attention deficit disorder with hyperactivity, eating disorders, e.g. anorexia nervosa and bulimia, or post tranmatic stress disorder. Diseases of the autonomous nervous system, e.g. Bradbury-Eggleston, Sky-Drager
determined. The beta 2-adrenergic receptor sequence variants can be used to develop therapeutics and/or lifestyle drugs. Individual specific beta 2-receptor agonists can be developed. Treatments can be optimized for individuals, including gene therapy and pharmaceutical intervention therapy. This sequence represents a variant of the wild type human beta 2-adrenergic receptor gene which is represented in AAZ00773.

           This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Beta 2-adrenergic receptor; human; hypotensive; cardiant; stroke; neuroprotector; immunosuppressor; predisposition; high blood pressure; cardiovascular disease; myocardial infarction; anxiety; depression; neuropsychiatric disease; attention deficit disorder; hyperactivity; eating disorder; anorexia nervosa; bulimia; migraine; allergy; drug; post-traumatic stress disorder; autonomous nervous system disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     disposition, or migraine, allergic conditions, e.g. asthma and atopic disorders, and metabolic illnesses, e.g. morbid obesity including predicting a change in weight, using body mass index, can also be determined. The beta 2-adrenergic receptor sequence variants can be used to develop therapeutics and/or lifestyle drugs. Individual specific beta 2-receptor agonists can be developed. Treatments can be optimized for individuals, including gene therapy and pharmaceutical intervention therapy. This sequence represents a variant of the wild type human beta 2-adrenergic receptor gene which is represented in AAZ00773.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                               Human; beta2-adrenergic receptor; beta2AR polymorphism; asthma; chromosome 5q31-32; migraine; congestive heart failure; hypertension; ischaemic heart disease; chronic obstructive pulmonary disease; COPD; obesity; diabetes mellitus; premature labour; vasotropic; cardiant; antiarrhythmic; antiasthmatic; antidiabetic; tocolytic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  drugs can be approved for use in the appropriate population, thereby decreasing the number of patients required for a clinical trial, which in turn decreases the duration and cost trials. The present sequence represents the human beta-adrenergic receptor-2 gene regulatory region (GenBank M15169, J02728, M16106). The polymorphic sites identified are 934A/G, 987C/G, 1006A/G, 1120C/G, 1221C/T,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  blockers) or calcium channel blockers). One or more polymorphic markers provides a basis for predicting the outcome of a treatment regimen. Fragments of the genes comprising a polymorphic site may be used as primers and probes for detecting genetic polymorphisms or in molecular library arrays for high throughput screening. The genes, and the proteins they encode are useful in the screening of potential cardiovascular drugs. Determination of an individual's polymorphic pattern reduces or eliminates trial and error in selecting a treatment for a particular individual cardiovascular pattient. It also provides the ability to
                                                                                                                                                                    variation

Adverse results in an early trial can be evaluated to identify polymorphic patterns so that the adverse results can be correlated with a sub-population of the test population, permitting exclusion of such sub-populations from the treatment group. Beneficial

The present invention relates to polymorphisms and haplotypes of Ct the human beta2-adrenergic receptor (beta2-R) gene located on Ct the human beta2-adrenergic receptor (beta2-R) gene located on Ct chromosome 5q31-32, and methods for haplotyping and/or genotyping the Ct chromosome 5q31-32, and methods for haplotyping and/or genotyping the Ct beta2AR gene in an individual. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers for callele-specific oligonucleotides (ASOS) as probes and primers for detecting the beta2AR gene polymorphisms. The beta2AR gene polymorphisms are useful in studying the expression and biological function of beta2AR, and for developing drugs targeting this receptor. They are also useful can developing drugs targeting this receptor. They are also useful corression or function of beta2AR such as congestive heart failure, as rhythmia, ischaemic heart disease, hypertension, migraine, asthma, chromic obstructive pulmonary disease (COPD), obesity, diabetes and premature labour. The method is useful for determining the frequency of a beta2AR genotype or haplotype in a population. The present sequence
                                                                                                                                                                                                                                                                                            Claim 1; Fig 1; 67pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                              engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11247 represents ESTs from Aspergillus Fusarium venenatum; AAF11248 to AAF11853 represents ESTs from Aspergillus niger; AAF11854 to AAF14878 represents ESTs from Aspergillus oryzae; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Multiple gene expression; filamentous fungal cell; EST; expressed sequence tag; Fusarium venenatum; Aspergillus niger; Aspergillus oryzae; Trichoderma reesei; identification; recombination; culture condition; environmental stress; spore morphogenesis; metabolic pathway engineering; catabolic pathway engineering; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be
                                                                                                                                                                                                                                                                                                                          adapt to changes in culture conditions, environmental stress, spore
                                                                                                                                                                                                                                                                                                                                                                   identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells
